## Review Tips

# Computable Functions

- ▶ In a formal theory of computability, every problem instance can be represented by a number and every number represents a problem instance.
- ▶ A problem is a function  $f : \mathbb{N} \rightarrow \mathbb{N}$  from numbers to numbers.
- ▶ A problem is computable if it can be calculated by a program.

# Decision Problem

A problem  $f : \mathbb{N} \rightarrow \mathbb{N}$  is a **decision problem** if the range  $\text{ran}(f)$  of  $f$  is  $\{0, 1\}$ , where **1** denotes a 'yes' answer and **0** a 'no' answer.

A decision problem  $g$  can be identified with the set  $\{n \mid g(n) = 1\}$ .

Conversely a subset  $A$  of  $\mathbb{N}$  can be seen as a decision problem via the **characteristic function** of  $A$ :

$$c_A(n) = \begin{cases} 1, & \text{if } x \in A, \\ 0, & \text{otherwise.} \end{cases}$$

# Decision Problem as Predicate

A decision problem can be stated as a predicate  $P(x)$  on number.

It relates to the problem-as-function viewpoint by the following **characteristic function** of  $P(x)$ :

$$c_P(n) = \begin{cases} 1, & \text{if } P(n) \text{ is valid,} \\ 0, & \text{otherwise.} \end{cases}$$

Decision Problem  $\Leftrightarrow$  Subset of  $\mathbb{N}$   
 $\Leftrightarrow$  Predicate on  $\mathbb{N}$

# REGISTER MACHINE

# Remark

**Register Machines** are more advanced than Turing Machines.

# Remark

Register Machine Models can be classified into three groups:

- ▶ **CM** (Counter Machine Model).
- ▶ **RAM** (Random Access Machine Model).
- ▶ **RASP** (Random Access Stored Program Machine Model).

# Synopsis

1. Unlimited Register Machine
2. Definability in URM

# UNLIMITED REGISTER MACHINE

# Unlimited Register Machine Model

The **Unlimited Register Machine** Model belongs to the CM class.

Computability and Recursive Functions, by J. Shepherdson and H. Sturgis, in Journal of Symbolic Logic (**32**):1-63, 1965.

# Register

An Unlimited Register Machine (**URM**) has an **infinite** number of **register** labeled  $R_1, R_2, R_3, \dots$

$r_1$	$r_2$	$r_3$	$r_4$	$r_5$	$r_6$	$r_7$	$\dots$
-------	-------	-------	-------	-------	-------	-------	---------

$R_1$     $R_2$     $R_3$     $R_4$     $R_5$     $R_6$     $R_7$     $\dots$

Every register can hold a **natural number** at any moment.

# Register

An Unlimited Register Machine (URM) has an infinite number of register labeled  $R_1, R_2, R_3, \dots$

$r_1$	$r_2$	$r_3$	$r_4$	$r_5$	$r_6$	$r_7$	$\dots$
-------	-------	-------	-------	-------	-------	-------	---------

$R_1 \quad R_2 \quad R_3 \quad R_4 \quad R_5 \quad R_6 \quad R_7 \quad \dots$

Every register can hold a natural number at any moment.

The registers can be equivalently written as for example

$$[r_1, r_2, r_3]_1^3 [r_4]_4^4 [r_5, r_6, r_7]_5^7 [0, 0, 0, \dots]_8^\infty$$

or simply

$$[r_1, r_2, r_3]_1^3 [r_4]_4^4 [r_5, r_6, r_7]_5^7.$$

# Program

A URM also has a **program**, which is a finite list of **instructions**.

# Instruction

Type	Instruction	Response of the URM
Zero	$Z(n)$	Replace $r_n$ by 0.
Successor	$S(n)$	Add 1 to $r_n$ .
Transfer	$T(m, n)$	Copy $r_m$ to $R_n$ .
Jump	$J(m, n, q)$	If $r_m = r_n$ , go to the $q$ -th instruction; otherwise go to the next instruction.

# Program Rules

- ▶  $P = \{l_1, l_2, \dots, l_s\} \rightarrow \text{URM}.$
- ▶ URM starts by obeying instruction  $l_1$ .
- ▶ When URM finishes obeying  $l_k$ , it proceeds to the next instruction in the computation,
  - ▶ if  $l_k$  is not a jump instruction, then the next instruction is  $l_{k+1}$ ;
  - ▶ if  $l_k = J(m, n, q)$  then next instruction is
    - ▶  $l_q$ , if  $r_m = r_n$ ; or
    - ▶  $l_{k+1}$ , otherwise.
- ▶ Computation stops when the next instruction is  $l_v$ , where  $v > s$ .
  - ▶ if  $k = s$ , and  $l_s$  is an arithmetic instruction;
  - ▶ if  $l_k = J(m, n, q)$ ,  $r_m = r_n$  and  $q > s$ ;
  - ▶ if  $l_k = J(m, n, q)$ ,  $r_m \neq r_n$  and  $k = s$ .

# Computation

Registers:

9	7	0	0	0	0	0	...
---	---	---	---	---	---	---	-----

$R_1$   $R_2$   $R_3$   $R_4$   $R_5$   $R_6$   $R_7$

Program:

$I_1 : J(1, 2, 6)$

$I_2 : S(2)$

$I_3 : S(3)$

$I_4 : J(1, 2, 6)$

$I_5 : J(1, 1, 2)$

$I_6 : T(3, 1)$

# Configuration and Computation

**Configuration:** register contents + current instruction number.

# Configuration and Computation

**Configuration:** register contents + current instruction number.

Initial configuration, computation, final configuration.

# Some Notation

Suppose  $P$  is the program of a URM and  $a_1, a_2, a_3, \dots$  are the numbers stored in the registers.

- ▶  $P(a_1, a_2, \dots, a_m)$  is  $P(a_1, a_2, \dots, a_m, 0, 0, \dots)$ .
- ▶  $P(a_1, a_2, a_3, \dots)$  is the initial configuration.
- ▶  $P(a_1, a_2, a_3, \dots) \downarrow$  means that the computation converges.
- ▶  $P(a_1, a_2, a_3, \dots) \uparrow$  means that the computation diverges.

# DEFINABILITY IN URM

# URM-Computable Function

Let  $f(\tilde{x})$  be an  $n$ -ary (partial) function.

What does it mean that a URM computes  $f(\tilde{x})$ ?

# URM-Computable Function

Suppose  $P$  is the program of a URM and  $a_1, \dots, a_n, b \in \mathbb{N}$ .

# URM-Computable Function

Suppose  $P$  is the program of a URM and  $a_1, \dots, a_n, b \in \mathbb{N}$ .

The computation  $P(a_1, \dots, a_n)$  converges to  $b$  if  $P(a_1, \dots, a_n) \downarrow$  and  $r_1 = b$  in the final configuration.

# URM-Computable Function

Suppose  $P$  is the program of a URM and  $a_1, \dots, a_n, b \in \mathbb{N}$ .

The computation  $P(a_1, \dots, a_n)$  converges to  $b$  if  $P(a_1, \dots, a_n) \downarrow$  and  $r_1 = b$  in the final configuration.

In this case we write  $P(a_1, \dots, a_n) \downarrow b$ .

# URM-Computable Function

Suppose  $P$  is the program of a URM and  $a_1, \dots, a_n, b \in \mathbb{N}$ .

The computation  $P(a_1, \dots, a_n)$  converges to  $b$  if  $P(a_1, \dots, a_n) \downarrow$  and  $r_1 = b$  in the final configuration.

In this case we write  $P(a_1, \dots, a_n) \downarrow b$ .

$P$  URM-computes  $f$  if, for all  $a_1, \dots, a_n, b \in \mathbb{N}$ ,  $P(a_1, \dots, a_n) \downarrow b$  iff  $f(a_1, \dots, a_n) = b$ .

# URM-Computable Function

Suppose  $P$  is the program of a URM and  $a_1, \dots, a_n, b \in \mathbb{N}$ .

The computation  $P(a_1, \dots, a_n)$  converges to  $b$  if  $P(a_1, \dots, a_n) \downarrow$  and  $r_1 = b$  in the final configuration.

In this case we write  $P(a_1, \dots, a_n) \downarrow b$ .

$P$  URM-computes  $f$  if, for all  $a_1, \dots, a_n, b \in \mathbb{N}$ ,  $P(a_1, \dots, a_n) \downarrow b$  iff  $f(a_1, \dots, a_n) = b$ .

The function  $f$  is URM-definable if there is a program that URM-computes  $f$ .

We shall abbreviate “URM-computable” to “computable”.

Let

 $\mathcal{C}$ 

be the set of computable functions and

 $\mathcal{C}_n$ 

be the set of  $n$ -ary computable functions.

# Example of URM I

Construct a URM that computes  $x + y$ .

# Example of URM I

Construct a URM that computes  $x + y$ .

$l_1 : J(3, 2, 5)$

$l_2 : S(1)$

$l_3 : S(3)$

$l_4 : J(1, 1, 1)$

## Example of URM II

Construct a URM that computes  $x \dot{-} 1 = \begin{cases} x - 1, & \text{if } x > 0, \\ 0, & \text{if } x = 0. \end{cases}$

## Example of URM II

Construct a URM that computes  $x \dot{-} 1 = \begin{cases} x - 1, & \text{if } x > 0, \\ 0, & \text{if } x = 0. \end{cases}$

# Function Defined by Program

$$f_P^n(a_1, \dots, a_n) = \begin{cases} b, & \text{if } P(a_1, \dots, a_n) \downarrow b, \\ \text{undefined}, & \text{if } P(a_1, \dots, a_n) \uparrow. \end{cases}$$

# Program in Standard Form

A program  $P = I_1, \dots, I_s$  is in **standard form** if, for every jump instruction  $J(m, n, q)$  we have  $q \leq s + 1$ .

# Program in Standard Form

A program  $P = I_1, \dots, I_s$  is in **standard form** if, for every jump instruction  $J(m, n, q)$  we have  $q \leq s + 1$ .

For every program there is a program in standard form that computes the same function.

# Program in Standard Form

A program  $P = I_1, \dots, I_s$  is in **standard form** if, for every jump instruction  $J(m, n, q)$  we have  $q \leq s + 1$ .

For every program there is a program in standard form that computes the same function.

We will focus exclusively on programs in **standard form**.

# Program Composition

Given Programs  $P$  and  $Q$ , how do we construct the sequential composition  $P; Q$ ?

# Program Composition

Given Programs  $P$  and  $Q$ , how do we construct the sequential composition  $P; Q$ ?

The jump instructions of  $P$  and  $Q$  must be modified.

# Some Notations

Suppose the program  $P$  computes  $f$ .

Let  $\rho(P)$  be the least number  $i$  such that the register  $R_i$  is not used by the program  $P$ .

# Some Notations

The notation  $P[l_1, \dots, l_n \rightarrow l]$  stands for the following program

$$\begin{array}{ll} l_1 & : T(l_1, 1) \\ & \vdots \\ l_n & : T(l_n, n) \\ l_{n+1} & : Z(n+1) \\ & \vdots \\ l_{\rho(P)} & : Z(\rho(P)) \\ - & : P \\ - & : T(1, l) \end{array}$$
